### **Document Change History**

Version	Date	Changed By	Items Changed Since Previous Version
2.0	1/29/2010	Kevin Puscas,	Applied consistent formatting/language and enhanced
		Rich Kernan,	clarity.
		Jackie Key	
2.1.0	3/22/2010	Kevin Puscas	Added information for specifying which NHIN profile and
			version of that profile is supported.
			Added HIEM service name to custom tModel.
			Added notificationproducer service name to custom tModel
			Added QueryForDocuments service name to custom
			tModel
			Added RetrieveDocuments service name to custom
			tModel
			Noted QueryForDocument, notificationproducer, RetrieveDocument will be deprecated at a future date
			Remevebocument will be deprecated at a future date
2.1.0.1	5/18/2010	Kevin Puscas	Deleted publickey entry from datamodel. Information will
			be maintained by ONC but not published in UDDI
			Added 3.2.2 which defines how Non-Production,, Pilot, or
			Emergent specs will be presented in the UDDI
2.1.0.2	6/20/2011	Chuck Hagan	Created appendix for custom tModels. Added two
			tModels for Patient Discovery Deferred Messaging,
			highlighted in yellow.
2.1.0.2 a	6/21/2011	Chuck Hagan	Added 'NHIN Specification' column to tModels table.
			Added tModels for Doc Submission and Admin
			Distribution, highlighted in yellow. Updated naming
			convention for the PD tModels.
2.1.0.3	7/25/2011	NHIN Technical	Added PatientDiscoveryAsyncReq and
		Committee	PatientDiscoveryAsyncResp to tModels Appendix for
	7/07/0044	ONIO	backwards compatibility.
3.0	7/27/2011	ONC	Finalized for Production Publication
3.0.1	12/5/2011	Benson Chang	Updated Appendix with supported version numbers of

Version	Date	Changed By	Items Changed Since Previous Version	
			services current as of 12/5/2011 until sunset date is	
			specified for 2010 specifications.	
3.0.2	12/9/2011	Benson Chang	Integrated feedback from Specifications Factory to	
			updated Appendix	
3.0.3	12/15/2011	Benson Chang	Typographical corrections in Appendix	
3.1	3/6/2012	ONC	Finalized for Production Publication	

### **Document Approval**

Version	Date	Approved By	Role
2.0	1/25/2010	NHIN Technical Committee	Approves NHIN Specifications for Production Use
2.1.0.1	2/1/2011	NHIN Technical Committee	Approves NHIN Specifications for Production Use
2.1.0.3	7/25/2011	NHIN Technical Committee	Approves NHIN Specifications for Production Use
3.0.3	3/1/2012	NHIN Coordinating Committee	Approves NHIN Specifications for Production Use

Substantial content changes to the specification relevant to this new publication version have been highlighted in yellow within the documentation to help implementers identify requirements that may affect industry implementations.

V3.1

#### 1 Preface

#### 1.1 Introduction

The Nationwide Health Information Network (NHIN) Web Service Interface specifications define the core set of standard services to be implemented by each node on the NHIN network in order exchange interoperable health information over the Internet. Health Information Organizations (HIOs) which act as nodes on the NHIN are termed NHIOs. These functional services provide discovery and information exchange capabilities and rest upon a foundational set of messaging, security, and privacy services.

This document presents the NHIN Web Services Registry Web Service Interface Specification. This specification enables nodes to discover each other through interactions with the NHIN Web Services Registry, which lists NHIN nodes, the NHIN web services supported by each node, and how to reach those service end points.

#### 1.2 Intended Audience

The primary audience for this NHIN Specification is the individuals responsible for implementing software solutions that will interact and utilize the NHIN Web Services Registry at Health Information Organizations (HIOs) who are, or seek to be, nodes on the NHIN network. This specification document is intended to provide an understanding of the context in which the web service interface is meant to be used, the behavior of the interface, the Web Services Description Language (WSDLs) used to define the service, and any Extensible Markup Language (XML) schemas used to define the content.

#### 1.3 Business Needs Supported by this Specification

Example business uses of the NHIN Web Services Registry are described below:

#### 1. Get all NHIO data

In this use case, an NHIO has been approved for participation within the NHIN and chooses to retrieve all information available in the Web Services Registry. It requests a list of all other NHIO's currently registered, and all the web services they support. This new NHIO will maintain its local cache of this information for use in responding to local requests to share and retrieve data. This NHIO will need to be notified when new NHIO's are added to the Web Services Registry or when an existing NHIO entry is changed. To do this the new NHIO will provide a subscription to the Web Services Registry requesting notification of updates.

It is envisioned that NHIOs will query a registry to obtain connection information for another NHIO, but then cache that information locally for subsequent communication with the other NHIOs, in order to improve performance and minimize network bandwidth. However, the means and frequency of local caching of this information is within the discretion of individual NHIOs and outside the scope of this specification. This specification does define a Subscription interface that NHIOs can use to be notified when changes are made to the registry, which should cause them to flush their local cache and then requery the Registry to obtain updated information.

#### 2. Get data about NHIO's by state

In this use case, an NHIO has been approved for participation within the NHIN. Given the scope of this NHIO, it does not request all NHIO's registered, but instead desires a subset of all NHIO's in a particular region or state. The new NHIO queries the Web Services Registry and specifies a list of states to restrict the results.

A similar use case comes up when a patient requests that records from an NHIO in a particular state be retrieved and the local NHIO has not previously searched for NHIO's in that state. In both these cases,

the requesting NHIO will want to subscribe for updates to its locally cached information, or new NHIO entries matching its original guery.

#### 3. Getting data by homeCommunityId

There are several potential use cases, which would require the ability to query the Web Services Registry by a specific homeCommunityId to retrieve the service connection information for the corresponding NHIO. For instance, the patient may have a printed paper, generated by an NHIO, which includes a homeCommunityId, perhaps even in a form that could be scanned. Another case is a notification may have been received which identifies the homeCommunityId which contains the record of interest and the NHIO receiving the notification may not have previously retrieved the service connection information for that NHIO. For these, and potentially others, the NHIO submits a query to the Web Services Registry specifying the homeCommunityId and receives the details about that community that have been saved in the Web Services Registry.

#### 1.4 Referenced Documents and Standards

The following documents and standards were referenced during the development of this specification. Deviations from or constraints upon these standards are identified below.

1) Org/SDO name: OASIS

Reference # / Spec Name: Universal Discovery and Description Interface (UDDI)

Version #: v3.0.2 Underlying Specs:

**NHIN Deviations or Constraints: None** 

Link: http://www.oasis-open.org/committees/uddi-spec/doc/spec/v3/uddi-v3.0.2-20041019.htm

#### 1.5 Relationship to Other NHIN Specifications

This specification is related to other NHIN specifications as described below.

The Web Services Registry specification addresses underlying infrastructure requirements for connection management among NHIOs. It, along with the Certificate Authority is one of the main components of the NHIN Operational Infrastructure.

- Messaging Platform specifies a base set of messaging standards and web service protocols, which must be implemented by each NHIN node and applies to all transactions. All NHIN internodal messages are SOAP messages over HTTP using web services, must be encrypted and digitally signed. This specification supports the Messaging Platform.
- Authorization Framework defines the exchange of metadata used to characterize each NHIN
  request. The purpose of that exchange is to provide the responder with the information needed
  to make an authorization decision for the requested function. Each initiating message must
  convey information regarding end user attributes and authentication using SAML 2.0 assertions.

Together, the Messaging Platform and the Authorization Framework define the foundational messaging, security and privacy mechanisms for the NHIN.

#### 2 Registry Description

#### 2.1 Definition

V3.1

The NHIN Web Services Registry Interface allows NHIOs to communicate with the NHIN Web Services Registry in order to locate and utilize the appropriate services offered by other NHIOs in a controlled, secure manner.

The NHIN Web Services Registry supports privacy and trust by restricting access only to NHIOs. The registry facilitates interoperability, by cataloging and advertising in real-time which services are supported by each organization.

#### **Design Principles and Assumptions** 2.2

The following assumptions or design principles underlie this specification:

- The NHIN Web Services Registry utilizes the OASIS UDDI v 3.0.2 specification for defining the capabilities of the registry
- The NHIN Web Services Registry supports a federated replication model allowing other organizations to operate their own NHIN Web Services Registry implementation.
- As per the OASIS UDDI v 3.0.2 specification, all exchanges are via standard web services interfaces.
- All communications to the NHIN UDDI Web Services Registry is done over 2-way SSL implemented with Public Key certificates.

#### 2.3 Triggers

The NHIN Web Services Registry Interface is invoked whenever a NHIO wishes to locate information about another NHIO, including its service end point and supported services. Scenarios describing when the Web Services Registry might be used are described in section 1.3 "Business Needs".

#### 2.4 **Transaction Standard**

This document focuses on the implementation and use of a NHIN Web Services Registry based on the OASIS specification for Universal Description and Discovery Interface (UDDI) registry version 3.0.2. In particular, this specification describes the following:

- Inquiry and Subscription Interfaces and Capabilities
- The Data Model to be used by to store registry entries
- The hierarchical replication strategy to be used by the NHIN for services registries.

#### 2.5 Technical Pre-conditions

The following technical pre-conditions exist for this interface specification:

- Prior to having their services information entered into the NHIN Web Services Registry, candidate NHIO's must complete an on-boarding process specified by the NHIN program office and the NHIN Coordinating Committee. This process includes:
  - Ensuring the organization is a valid organization and its sole intention is in line with the purposes of the NHIN
  - Ensuring the organization has appropriate policies and governance agreements to protect the data it is given
  - Ensuring the organization is able to reliably and securely provide the minimum NHIN services

Only through this bootstrapping process can a candidate HIO have its information saved in the Web Services Registry. Thus the users of the Web Services Registry can be assured that organizations listed within it are in fact validated NHIOs.

#### **Technical Post-conditions**

The following technical post-conditions will result after the execution of this interface specification:

An instance of the NHIN Web Services Registry will be established with the required information meta-models and an implementation of the interfaces defined in this specification.

#### 3 Registry Definition

#### **Supported NHIN Web Services Registry Interfaces**

#### 3.1.1 Inquiry API (Client discovery API)

The UDDI V3.0.2 inquiry APIs (http://uddi.org/pubs/uddi-v3.00-published-20020719.htm#\_Toc42047277) provide a simple and complete set of programming interfaces, these interfaces can be used to:

- Search the UDDI registry to locate registry entries pertaining to the given search criteria
- Drill down gueries to retrieve further details of a given registry entry.
- Add qualifiers to queries based on information such as unique key values, categories, identifiers,

Note that for the NHIN Web Services Registry the APIs are invoked over a SSL transport layer and the authentication/authorization mechanism is based on PKI/X509.

#### **Subscription API** 3.1.2

Subscription provides clients, known as subscribers, with the ability to register their interest in receiving information concerning changes made in a UDDI registry. Any UDDI registry user can subscribe to a set of UDDI entities and monitor their creation, modification and deletion. The subscription is defined using standard UDDI get or find API calls. The UDDI registry notifies the user whenever any entity that matches the subscription query changes even if the change causes the entity to not match the query anymore. It also notifies about entities that were changed in a way that after the change they match the subscription query.

Subscription allows subscribers to "monitor" a particular subset of data within a registry. Two patterns are defined. UDDI nodes MAY support either or both: The notification might be synchronous or asynchronous. Synchronous notification occurs when the interested party explicitly asks for all changes that have happened since the last notification. Asynchronous notifications are run periodically in a configurable interval and the interested party is notified whenever the matched entity is created, modified. or deleted. In case of an NHIO, it is recommended to use asynchronous notification from a performance point of view.

The duration, or life of a subscription is also a matter of node policy, but subscribers can renew existing subscriptions periodically instead of having to create new ones. Subscribers may also create multiple subscriptions. Each subscription request is treated independently.

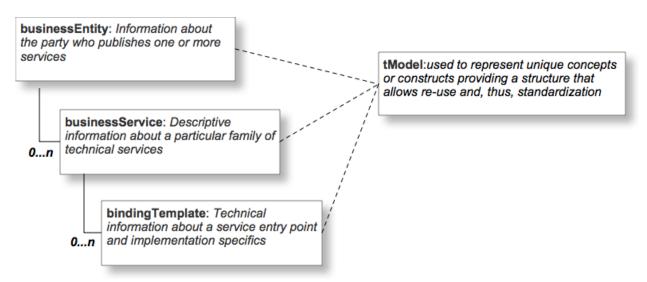

NHIO gateways will implement an HTTP/SOAP based web services as subscription listeners. The UDDI registry will send a notification to this web service endpoint.

Please see the UDDI specification on Inter-Node Operations (http://uddi.org/pubs/uddi-v3.00-published-20020719.htm# Toc42047327) for more details.

#### 3.2 NHIN Data Model

The UDDI data model is composed of four primary "top-level" entities each identified by a unique identifier (UUID).

These four elements provide the meta-model used to describe the NHIO entities and services they offer on the NHIN within the NHIN Web Services Registry. The tables below describe each of the data items used to describe a NHIO and their services. Note that **bold** elements represent containers for one or more sub-elements such as identifier or categorization elements. Items marked <<item>> represent information that is provided by the NHIO. All other information is standardized within the NHIN Web Services Registry and will be managed by the appropriate administration personnel.

<b>=</b>	D. G. Brand	T (T 10/.)	New

be the name of individual profile (ex. GIPSE,

CARE. ...)

A complete list of custom NHIN tModels will be maintained in the "Appendix: NHIN Custom tModels" section of this document.

#### 3.2.1 Non-Production, Pilot, or Emergent Specifications or Profiles

In certain circumstances approved by the NHIN governance bodies, interface or profile specifications will need to be introduced into the production NHIN Exchange as part of Pilot or Emergent projects among NHIN Exchange participants. In order to denote the implementations of these non-production specifications by a NHIN Exchange participant, the standard-servicename keyName and keyValue will be post-fixed with NON-PROD (ex. DocumentSubmission-NON-PROD). Once the NHIN Exchange governance bodies have approved the specification for production use, a new standard-servicename will be added that removes the post-fix NON-PROD designation (ex. DocumentSubmission).

<sup>\*</sup> If the NHIN service specification defines more than one operation then the operation name will be appended to the uniformservice name to ensure that the servicekey is unique

#### 3.3 UDDI Replication

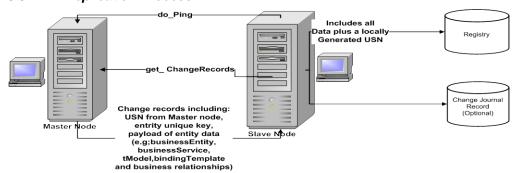

#### 3.3.1.1 Replication Concepts

The NHIN Web Services Registry is designed to be highly scalable and redundant based on a Master/Slave replication model that is part of the UDDI v3 specifications. This model is similar to that used by the Domain Name Services (DNS) infrastructure that is part of the backbone of the Internet. All new entries or updates first occur in the master NHIN Web Services Registry. This is then propagated to all slave registries. NHIE Nodes can query whichever registry is most appropriate and likewise can subscribe to updates to those registries. The NHIN Web Services Registry architecture therefore allows updates to not only flow to other registries but to the NHIN nodes as well. This can be seen in the figure below.

#### 3.3.1.2 Replication Process

Following are the steps, which occur during replication process:

- Step 1 The slave node does a "ping" to the master nodes to see if it is available.
- Step 2- If the master node is available then it makes a call to the master node to request information on any changed records.
- **Step 3** Then the master node will send the changed records to the requesting node, which incorporates them into its own repository.

See the UDDI v3 replication specification (<a href="http://uddi.org/pubs/uddi-v3.00-published-20020719">http://uddi.org/pubs/uddi-v3.00-published-20020719</a>. htm# Toc42047358) for more detailed information.

#### 3.4 NHIO Web Services Registry Security Model:

NHIN will use Public Key Infrastructure (PKI) technologies to encrypt messages sent between participating entities. Digital certificates are issued and managed using a managed PKI infrastructure (mPKI) service, which ensures that all certificates used on the NHIN contain a common intermediary identifier. These digital certificates are only given to NHIN participating organizations after they have completed the on-boarding processes required by the NHIN governance bodies. This ensures that only NHIN nodes can encrypt/decrypt messages sent over the network. As with all other communication between NHIN nodes, communication with the NHIN Web Services Registry depends on the exchange of these issued digital keys. This includes all inquiry, subscription and replications exchanges.

### 4 Appendix: NHIN Custom tModels

Below are the custom tModels used in the NHIN data model to provide standardized values for certain data items.

Note: The tModels are currently maintained in this appendix, but in future Specification releases the tModels will be migrated to and maintained in the appropriate NHIN Specification as noted by the 'NHIN Specification' Column.
